The invention relates to KVLQT1 and KCNEI genes, associated with long QT (LQT) syndrome. It provides a mink protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp, Leu, His, Trp and Ala or Thr at residues 74,76,28,32,98 and 127 respectively. Screening KVLQT1 and KCNEI is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. The present sequence represents the cDNA encoding
                                  ns of genes encoding minK protein and KVLQT1 protein invopotassium channel formation useful for screening drugs, and treating cardiac arrhythmia
                                                                                                                                                                                                                                                                                                                                    0

The invention relates to KVLQT1 nucleic acids which have a mutation compared to wild-type KVLQT1. This sequence corresponds to the human wild type KVLQT1 cDNA sequence. The sequence encodes a protein of 676 amino acid which forms a cardiac I(ks) potassium channel with the KCNEI protein (AAY80563). The KVLQT1 gene contains 15 introns and encodes a protein containing 6 putative transmembrane segments and a pore forming region. The gene has been mapped to the chromosomal location 11p15.5. Mutations in the KVLQT1 or KCNEI genes result in cardiac arrhythmias observed as a prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used for the diagnosis of 3120 KVLQT1; mutation; human; cardiac I(ks) potassium channel; KCNR1; ss; cardiac arrhythmia; electrocardiogram; Long QT syndrome; gene therapy; chromosome 11p15.5. tgccagctgctgagccgcagagagtgacggttcctacacaggacaggggttccttctgg gcattacatcgcatagaaatcaataatttgtggtgatttggatctgtgttttaatgagtt aacccctcgcccagtcccagccagccaaccacacagaagggactgccactcccct Connors TD; mutant KVLQT1 nucleic acids, useful for developing the diagnosis, prevention and treatment of long  $Q\mathsf{T}$ Landes GM, Human long QT syndrome-associated KVLQT1 cDNA Curran ME, Claim 1; Fig 5A-B; 178pp; English.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is the coding sequence for wild-type human KVLQT1. KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome 11p15.5. The present invention relates to a mutant KVLQT1 coding sequence (see AAC89914). The mutant KVLQT1 coding sequence is useful in the diagnosis of long QT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome.

```
KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome llpl5.5. The present sequence is a mutant KVLQT1 coding sequence. The mutant KVLQT1 coding sequence is useful in the diagnosis of long QT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome.
                                                                                                                                                                                                                                   DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or, diagnosing or prognosing JLN -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cagggccgcgtctacaacttcctcgagcgtcccaccggctggaaatgcttcgtttaccac 540

```
cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to the chromosome Ilpl5. The present sequence is a mutant KVLQT1 coding sequence. The mutant KVLQT1 coding sequence is useful in the diagnosis of long OT syndrome and in screening humans for the presence of KVLQT1 gene
                            in the KVLQT1 gene
                                                                                                                                                                                                cgtggcctccatggtggtcctctgcgtgggctccaaggggcaggtgtttgccacgtcggc

```
This cDNA sequence includes a full-length coding sequence for human KVLQT1 (see AAW3335), a novel cardiac potassium channel protein.

C The sequence was assembled from partial clones isolated from human pancreatic and cardiac cDNA libraries. KVLQT1 was mapped to chromosome lip15.5 making it a candidate for the long QT syndrome [C LQT) gene. LQT is an inherited cardiac arrhythmia. If Families with mutations in KVLQT1 have been identified and it was shown that in all 16 families there was complete linkage between LQT1 and KVLQT1. The KVLQT1 gene product coassembles with human mink to comman cardiac IKS potassium channel. IKS dysfunction is a cause of cardiac arrhythmia. Coexpression of KVLTQ1 and mink in a host cell provides a means for screening for drugs useful in treating or preventing LQT. Analysis of the KVLQT1 gene will provide an early diagnosis of subjects with LQT. A claimed method of assessing the clisk in a human for LQT syndrome comprises screening for a mutation in the KVLQT1 gene. Transgenic animals expressing human mink and
                                                                                                                                                                                                                                                                                                                                            to develop

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This cDNA sequence includes a full-length coding sequence for human KVLQT1 (see AAM30038), a novel cardiac potassium channel protein. The sequence was assembled from partial clones isolated from human panoreatic and cardiac cDNA libraries. KVLQT1 was mapped to chromosome 11p15.5 making it a candidate for the long QT syndrome (LQT) gene. LQT is an inherited cardiac arrhythmia. One intragenic deletion and 10 different missense mutations which cause LQT have been identified in KVLQT1. The KVLQT1 gene product coassembles with human mink to form a cardiac IKS potassium channel.

Coexpression of these 2 proteins in a host cell provides a means for screening for drugs useful in treating or preventing LQT. The products can also be used for studying mechanisms underlying common
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for

                                                               AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB5324 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The colon coloudes may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       system disorders, muscular disorders, reproductive disorders, gastrointestinal disorders, wounds, renal disorders, infectious diseases, and cardiovascular disorders.                                                   This cDNA sequence includes a full-length coding sequence for human KVLQT1 (see AAW33355), a novel cardiac potassium channel protein. The sequence was assembled from partial clones isolated from human pancratic and cardiac cDNA libraries. KVLQT1 was mapped to chromosome 11p15.5 making it a candidate for the long QT syndrome (LQT) gene. LQT is an inherited cardiac arrhythmia. If Families with mutations in KVLQT1 have been identified and it was shown that in all 16 families there was complete linkage between LQT1 and KVLQT1. The KVLQT1 gene product coassembles with human mink to compare acrdiac fix potenssium channel. IKS dysfunction is a cause of cardiac arrhythmia. Coexpression of KVLQT1 and mink in a host cell provides a means for screening for drugs useful in treating or preventing LQT. Analysis of the KVLQT1 gene will provide an early
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                           diagnosis of subjects with LQT. A claimed method of assessing the risk in a human for LQT syndrome comprises screening for a mutation in the KVLQT1 gene. Transgenic animals expressing human mink and KVQLT1 can be used to test therapeutic agents against LQT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .;

RESULT 1

```
This cDNA sequence includes a full-length coding sequence for human KVLQT1 (see AAW30008), a novel cardiac potassium channel protein. The sequence was assembled from partial clones isolated from human pancreatic and cardiac cDNA libraries. KVLQT1 was mapped to chromosome 11p15.5 making it a candidate for the long QT syndrome (LQT) gene. LQT is an inherited cardiac arrhythmia. One intragenic deletion and 10 different missense mutations which coassembles been identified in KVLQT1. The KVLQT1 gene product coassembles with human mink to form a cardiac IKs potassium channel. Coexpression of these 2 proteins in a host cell provides a means for screening for drugs useful in treating or preventing LQT. The products can also be used for studying mechanisms underlying comparing contains the coassembles arrhythmias and for presymptomatic diagnosis of LQT. Transgenic

cardiac arrhythmia (long or syndrome); epilepsy; and Bartter's syndrome. As potassium channels are critical components of virtually all cells, it is likely that abnormal potassium channels are also implicated in certain renal, cardiovascular and central nervous system (CNS) disorders. Nucleotides encoding K+Hnov proteins may be used for identifying homologous or related proteins and the DNA sequences encoding them. They may be used to produce compositions that modulate the expression and function of the K+Hnov protein and in studying the blochemical pathways associated with it. They may also be used for the recombinant production of K+Hnov protein in fermentation cultures.
                                                                                                                                                                                                                                                                                                                                                                                  cDNAs were isolated by extension of expressed sequence tags (ESTS) which were related but not identical to known human potassium channels. Potential polymorphisms detected as sequence variants between multiple independent clones. Potassium channels have critical roles in various cell types and blochemical pathways. Defective potassium channels are known to cause four human diseases: episodic ataxia with myokymia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Additionally, such nucleotides may be used in gene therapy protocols for the treatment of diseases associated with abnormal potassium channels.
                                                                                                                                                                                                             This sequence represents a DNA encoding a pore domain from a human potassium channel and was used in the identification and isolation of human K+Hnov cDNAs (AAZI1897-Z11915). K+Hnov proteins have a high degree of homology to known potassium channels and may be alpha subunits, which form the functional channel, or accessory subunits that act to modulate the channel activity. K+Hnov
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 45 BP; 9 A; 10 C; 18 G; 8 T; 0 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       such nucleotides

```
KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome llpl5.5. The present sequence is a mutant KVLQT1 coding sequence. The mutant KVLQT1 coding sequence is useful in the diagnosis of long QT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or diagnosing or prognosing JLN -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               double-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT1900! T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of GDNA was intitated from the 3'-cend of mRNA by using poly(T) as the sole primer. Since the 3'-cuntranslated sequence is unique to a particular mRNA species, almost all the 3'-criented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for recognising different cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                               Gene signature; messenger RNA; mRNA; relative abundance; frequency; human; cloning; mapping; non-biased library; diagnosis; detection; cell typing; abnormal cell function; ss.

KVLQT1 maps to chromosome 11p15.5. The present sequence is a mutant KVLQT1. The coding sequence for the present protein is useful in the diagnosis of long OT syndrome and in screening humans for the presence of KVLQT1 gene variants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or diagnosing or prognosing JLN -
                             This invention describes a novel eukaryotic expression vector (A) comprising a nucleic acid sequence (I), encoding a potassium channel subunit (II), arranged so that it can be functionally expressed in eukaryotes. (A) are used to express bacterial potassium channels in eukaryotes, specifically for screening compounds for their ability to open, close or (in)activate the channels or to alter their biophysical properties, especially to identify potential antibiotics.
                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; KVLQT1; antiarrhythmic; cardiant; gene therapy;

                                                     This invention describes novel human and mouse potassium channel proteins KCNQ2 and KCNQ3. Detecting mutations in sequences that encode KCNQ2 or KCNQ3, or the loss of one copy of these genes, is used for diagnosis and prognosis of benign familial neonatal epilepsy (BFNE), juvenile myotonic epilepsy (JME) or rolandic epilepsy (RE). Cells (or transgenic animals) that express wild-type or mutant KCNQ2 or 3 (also the proteins themselves in cell-free form) are used to screen for agents that can be used to nucleic acids are used as probes or primers, either for detecting mutations or for isolation of related sequences, while the complete sequences may be used in gene therapy to provide wild-type protein. Antibodies specific for mutant or wild-type proteins are used as diagnostic reagents and for drug screening the KCNQ2 and 3 proteins are considered.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 useful in rational design of drugs and therapeutically (in replacement therapies). The forms of epilepsy associated with mutations in KCNQ2 and 3 sequences can now be diagnosed early (before symptoms are manifest), and better treatment options will be available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

KCNQ2 and KCNQ3. Detecting mutations in sequences that encode KCNQ2 or KCNQ3, or the loss of one copy of these genes, is used for diagnosis and prognosis of benign familial neonatal epilepsy (BFNE), juvenile myotonic epilepsy (RE). Cells (or transgenic animals) that express wild-type or mutant KCNQ2 or 3 (also the proteins themselves in cell free form) are used to screen for agents that can be used to nucleic acids are used as probes or primers, either for detecting mutations or for isolation of related sequences, while the complete sequences may be used in gene therapy to provide wild-type protein. Antibodies specific for mutant or wild-type proteins are used as diagnostic reagents and for drug screening. The KCNQ2 and 3 proteins are
                                                                                                                                      This invention describes novel human and mouse potassium channel proteins
                                                                                                                                                                                                                                                                                                                                                                                      useful in rational design of drugs and therapeutically (in replacement therapies). The forms of epilepsy associated with mutations in KCNQ2 and 3 sequences can now be diagnosed early (before symptoms are manifest), and better treatment options will be available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Expression vector for bacterial potassium channel that is functional in eukaryotic cells, used to screen for channel modulators and potential antibiotics -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is wild-type human KVLQT1. KVLQT1 is a cardiac potassium channel and mutations in the KVLQT1 gene cause Jervell and Lange-Nielsen Syndrome (JLN). KVLQT1 maps to chromosome 11p15.5. The present invention relates to a mutant KVLQT1 coding sequence (see AAC8914). The mutant KVLQT1 coding sequence is useful in the diagnosis of long QT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome.
                                                                                                                                                                                                                                                                                         DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or diagnosing or prognosing JLN -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                         The invention relates to KVLQT1 and KCNE1 genes, associated with long QT (LQT) syndrome. It provides a mink protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp. Leu, His, Trp and Ala or Thr at residues 74,76,28,32,39 and 127 respectively. Screening KVLQT1 and KCNE1 is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. The present sequence represents the human
                                                                                                                                                                                                                                                                                Mutant forms of genes encoding mink protein and KVLQT1 protein involved in cardiac potassium channel formation useful for screening drugs, for preventing and treating cardiac arrhythmia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           KVLQT1; mutation; human; cardiac I(ks) potassium channel; KCNB1;

compared to wild-type KVLQTI. This sequence corresponds to the human wild type KVLQTI protein. The protein forms a cardiac I(ks) potassium channel with the KCNEI protein (AAY80563). The KVLQTI protein contains 6 putative transmembrane segments and a pore forming region. Mutations in the KVLQTI or KCNEI genes result in cardiac arrhythmias observed as a prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used for the diagnosis of subjects with long QT syndrome. They can also be used to screen for drugs which can be used for treating or preventing long QT syndrome. The KVLQTI nucleic acids can be used for gene therapy, and KVLQTI peptides can be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; KVLQT1; antiarrhythmic; cardiant; gene therapy; cardiac potassium channel; Jervell and Lange-Nielsen Syndrome; JLN; chromosome llp15.5; long QT syndrome.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human minK and Xenopus \mathtt{KVLQT1} coding sequences - used for assays for identifying drugs which can be used for preventing or treating long
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This protein comprises a novel human cardiac potassium channel protein. It is encoded by the KVLQT1 gene (see AAT90730) that is associated with long QT syndrome (LQT) gene, an inherited cardiac arrhythmia. RVLQT1 protein coassembles with human mink to form the cardiac IKs potassium channel. IKs dysfunction is a cause of cardiac arrhythmia. Coexpression of KVLQT1 and mink in a host cell provides a means for screening for drugs useful in treating or preventing LQT. The products can also be used for truging mechanisms underlying common arrhythmias and for presymptomatic diagnosis of LQT. Transgenic animals that express human mink and KVQLT1 can be used to test therapeutic agents
                                      \mathtt{KVLQT1}; long QT syndrome; arrhythmia; minK; potassium channel; diagnosis; therapy; human.
          Human KVLQT1 associated with long QT syndrome.

KVLQT1 maps to chromosome l1pl5.5. The present sequence is a mutant KVLQT1. The coding sequence for the present protein is useful in the diagnosis of long QT syndrome and in screening humans for the presence of KVLQT1 gene variants which cause JLN syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA encoding for a mutant KVLQT1 which causes Jervell and Lange-Nielsen syndrome (JLN) when homozygous, useful for diagnosing long QT syndrome, or diagnosing or prognosing JLN -

                                                                                                                                                                                                                                                                                              The invention relates to KVLQT1 and KCNE1 genes, associated with long OT (LQT) syndrome. It provides a mink protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp. Leu, His, Trp and Ala or Thr at residues 74.76.28.32.98 and 127 respectively. Screening treating LQT and KCNE1 is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. The present sequence represents the human
                                                                                                                                                                                                                    Mutant forms of genes encoding mink protein and KVLQT1 protein involved in cardiac potassium channel formation useful for screening drugs, for preventing and treating cardiac arrhythmia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      185 GOVFATSAIRGIRFLQILRMLHVDRQGGTWRLLGSVVFIHRQELITTLYIGFLGLIFSSY 244

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Transgenic animals that express
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This protein comprises a novel human cardiac potassium channel protein. It is encoded by the KVLQT1 gene (see AAT94004) that is associated with long QT syndrome (LQT) gene, an inherited cardiac arrhythmia. KVLQT1 protein coassembles with human mink to form the cardiac IKs potassium channel. IKs dysfunction is a cause of cardiac arrhythmia. Coexpression of KVLQT1 and mink in a host cell provides a means for screening for drugs useful treating or preventing LQT. The products can also be used for studying mechanisms underlying common arrhythmias and for presymptomatic diagnosis of LQT. Transgenic animals that express

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                              The invention relates to KVLQT1 nucleic acids which have a mutation compared to wild-type KVLQT1 (AAZ98901). The KVLQT1 gene encodes a protein of 676 amino acids which forms a cardiac I(KS) potassium channel with the KCNE1 protein (AAX980563). THE KCNE1 protein has been shown to be functional in Xenopus leavis oocyte when KCNE1 DNA is injected into the egg, indicating that a hommologue of the human KVLQT1 gene is present in Xenopus. The human KVLQT1 gene was then used to probe a DNA library to isolate the sequence encoding this protein. Mutations in the KVLQT1 or KCNE1 genes result in cardiac arritythmias observed as a prolonged QT curve in electrocardiograms (Long QT syndrome). The genes and proteins can be used to screen for drugs which can be used for treating or preventing long QT syndrome. The KVLQT1 nucleic acids can be used for can also be used to screen for drugs which can be used for treating or gene therapy, and KVLQT1 peptides can be used for peptide therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FAISFFALPAGILGSGFALKVQQKQRQKHFNRQIPAAASLIQTAWRCYAAENPDSATWKI 360

The invention relates to KVLQT1 and KCNEI genes, associated with long QT (LQT) syndrome. It provides a mink protein comprising a mutation which substitutes the wild type amino acids with Leu, ASP, Leu, His, Trp and Ala or Thr at residues 74,76.28,32.98 and 127 respectively. Screening KVLQT1 and KCNEI is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. The present sequence represents the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Mutant forms of genes encoding minK protein and KVLQT1 protein involved in cardiac potassium channel formation useful for screening drugs, for preventing and treating cardiac arrhythmia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0; Gaps

                     (see AAW30038), a protein associated with long QT syndrome (LQT). A CDNA clone encoding Xenopus KVLQT1 was isolated from an occyte cDNA library by homology to human KVLQT1 cDNA (see AAT90730). Human KVLQT1 cDNA (see AAT90730). Human change. Coexpression of these proteins in a cardiac IKs potassium channel. Coexpression of these proteins in a cell can be used to screen for drugs useful in treating or preventing LQT.

                                                                                                                                                                        The invention relates to KVLQT1 and KCNE1 genes, associated with long OT (LQT) syndrome. It provides a mink protein comprising a mutation which substitutes the wild type amino acids with Leu, Asp. Leu, His, Trp and Ala or Thr at residues 74.76,28.32,98 and 127 respectively. Screening KVLQT1 and KCNE1 is useful for identifying mutations for diagnosing and treating LQT. The ability to predict LQT enables physicians to prevent the diseases with medical therapy such as beta blocking agents and opts for better treatments. The present sequence represents a Xenopus KVLQT1 partial protein fragment.
                                       Mutant forms of genes encoding minK protein and KVLQT1 protein involved in cardiac potassium channel formation useful for screening drugs, for preventing and treating cardiac arrhythmia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              KVLQT1; mutation; human; cardiac I(ks) potassium channel; KCNEI; ss; cardiac arrhythmia; electrocardiògram; Long QT syndrome; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          180

-!- FUNCTION: GENE BET PROTEIN FUNCTIONS IN GENERAL RECOMBINATION AND IN THE LATE, ROLLING-CIRCLE MODE OF LAMBDA DNA REPLICATION.

HAS A FUNCTION SIMILAR TO THAT OF E.COLI RECT. IT IS A SINGLE-STRANDED DNA BINDING PROTEIN THAT CAN PROMOTE RENATURATION OF DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SEQUENCE OF 1-103 FROM N.A.

-:- TISSUE SPECIFICITY: EXPRESSED IN THE OUTER, BUT NOT THE INNER, SENSORY HAIR CELLES OF THE COCHILEA.
-:- DOMAIN: THE SEGMENT S4 IS PROBABLY THE VOLTAGE-SENSOR AND IS CHARACTERIZED BY A SERIES OF POSITIVELY CHARGED AMINO ACIDS AT EVERY THIRD POSITION (BY SIMILARITY).
-:- DISEASE: DEFECTS IN KCNO4 ARE A CAUGE OF AUTOSOMAL DOMINANT NONSYNDROMIC SENSORINEURAL DEAFNESS TYPE 2 (DFNA2).
-:- SIMILARITY: THIS CHANNEL PROTEIN BELONGS TO THE DELAYED RECTIFIER CLASS. KQT SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        "Mutations in the KCNQ4 gene are responsible for autosomal dominant deafiness in four DFNA2 families."; Hum. Mol. Genet. 8:1321-1328(1999).
